

**METHOD OF DEVELOPING A PRODUCT WHILE CONSIDERING QUALITY****FEATURES OF THE PRODUCT****ABSTRACT**

The invention relates to a method in which at least two components which are to be included in the product are defined for a product to be developed. In a test procedure it is checked for each component whether the characteristic product quality values established for the product are achieved by the characteristic component quality values determined for this component even when this component is combined with further component. If the result of the test is negative, the component is modified and the test procedure is repeated.
